GEAR FLOW METER VHM

GEAR FLOW METER VHM SERIES

We have developed a high precision flow meter for a wide variety of liquids, especially liquids with high abrasiveness and poor lubricity.

Applications include: chemical, petrochemical, pharmaceutical and cosmetic industry, two-component mixers, paints, aviation.

VHM flow meters are dead space optimised for use in the paint industry and for paint spraying systems (easy flushing).

They are positive displacement units based on the meshing gear principle. Each tooth generates an impulse by recognition of the gear rotation by a non-contact detection system according to the carrier frequency principle.

VHM flow meters are available with single, double or quadruple resolution, signal-output with NPN- or PNP-switching mode.

Signal pick-ups with  certification (Ex ia IIC T4 ... T6) and signal pick-ups with a fibre optic output are applicable for hazardous locations.

TECHNICAL DATA

Size	Flow range		K-factor Imp./l	
	l/min	GPM	Imp./l	Imp./Gal.
VHM 01-2	0.01 ... 1 l/min	0.003 ... 0.264	approx. 22,000	approx. 87,000

Type key

Signal pick-up

GENERAL PRINCIPLE OF FUNCTIONING

The two gear wheels of the instrument are set into motion by the volume flow passing through the flow meter. Each tooth of the gear wheel is scanned by a single or double signal pick-up, which is screwed to the flow meter.

When the gear wheel rotates, this signal pick-up generates an electrical output impulse, when a tooth of the wheel passes the scanning range.

Each conveyed tooth gap volume corresponds to one electrical output impulse for a single signal pick-up, or 2 or 4 electrical output impulses for a double signal pick-up, depending on the jumper coding. This volume

is enclosed between the tooth gaps of the wheel and the body and is conveyed to the outlet side by the rotation of the gear wheel. The volume conveyed out of a tooth gap is designated as the measuring volume V_m , which determines the significance of the impulses depending on the size of the flow meter.

$$V_m (l/Imp.) = 1 / K\text{-factor}$$

The frequency of the output impulse signal is processed in the associated electronic circuit and is proportional to the speed of rotation of the gear wheel and to the flow velocity. The flow quantity corresponds to the conveyed volume, which is measured by constant electronic counting of the output impulses.

TYPE CODES – SIGNAL PICK-UP

SELECTION CRITERIA – SIGNAL PICK-UPS

	Single pick-ups series VI .../VT ...	Double pick-ups series VD .../VE ...
General applications	Flow velocity measurement and volume measurement	Flow velocity measurement and volume measurement with high signal resolution
Measured volume signal resolution per conveyed tooth gap volume	1 impulse/measured volume	a) 2 impulses/measured volume or 4 impulses/measured volume optionally coded by jumpers in the pick-up b) 1 impulse/measured volume in modified series VE ...
Galvanic isolation between the supply voltage and the signal output	NPN- or PNP-switching optocoupler output	NPN- or PNP-switching optocoupler output
When 2 single pick-ups are used in one flow meter body, the following possibilities arise	a) A high signal resolution and detection of the flow direction are possible with additional electronics b) Or it is possible to implement a redundant system for increased safety in conjunction with the separate operation of both pick-ups. c) Separate power supply of the single pick-ups from galvanically isolated power supply units is possible.	
EX-Design	With intrinsic safety only in conjunction with VSE barrier amplifier Ex-designation Ex ia IIC T4 ... T6	With intrinsic safety only in conjunction with VSE barrier amplifier Ex-designation Ex ia IIC T4 ... T6

VHM SINGLE PICK-UPS AND DOUBLE PICK-UPS IN STANDARD DESIGN

The single pick-up operates with a carrier frequency oscillator, which is modulated when a tooth passes. This modulation is detected by the amplifier and is used to generate one digital impulse per measured volume.

The double pick-up operates with two independent carrier frequency oscillators, which are modulated when a tooth passes. This modulation is detected by the amplifier and is used to generate 2 or 4 digital impulses per measured volume, which can be selected by the coding of the internal jumpers.

Single and double pick-ups are equipped with an optocoupler transistor output, which has a galvanic isolation between supply voltage and pick-up.

This transistor output can be connected with the supply voltage of the pick-up as shown in the below connection diagrams or can be operated with a separate power supply. Depending on the polarity of the power supply to the transistor, either a PNP- or a NPN-switched output signal is generated.

OUTPUT SIGNAL PNP-SWITCHED

OUTPUT SIGNAL NPN-SWITCHED

SINGLE PICK-UPS AND DOUBLE PICK-UPS IN EX-DESIGN

The single pick-up operates with a carrier frequency oscillator, which is modulated when a tooth passes. The double pick-up operates with two independent carrier frequency oscillators, which are modulated when a tooth passes.

This modulation is detected by the amplifier and is used to generate a pulsing current signal in the supply current. The connected barrier amplifier detects the signal and generates a digital PNP signal for further processing. The output impulses per measured volume correspond to those of the two standard designs.

Single pick-ups and double pick-ups in Ex-design are designed for intrinsic safety and may only be used in conjunction with the VSE barrier amplifier MK 13-P-Ex 0/24 V DC/K15.

The flow meter with the single pick-up or double pick-up is located in the hazardous area. The barrier amplifier is installed outside the hazardous area in an electrical cabinet or terminal box (snap-in mounted on an installation rail DIN 50022).

DOUBLE PICK-UP WITH FIBRE OPTIC OUTPUT TYPE VDB...

Applications under extremely difficult conditions	Applications	Measured volume signal resolution per conveyed tooth gap volume	Battery operation with energy saving circuit
a) Environments with heavy electromagnetic interference b) High voltage areas c) Rooms with explosion hazards, e.g. spray painting equipment with electrostatic charge	In flow velocity measurement and volume measurement with high signal resolution	2 impulses / measurement volume	2 years of operation without battery change

DOUBLE PICK-UP WITH FIBRE OPTIC OUTPUT TYPE VDB...

The double pick-up converts electrical impulses into light impulses and transmits these through a plastic optical fibre to the receiver, which is installed away from the extreme conditions. This converts the light impulses of the signal pick-up back into electrical impulses and outputs them to electronic evaluation devices for further processing. The output signal of the fibre optic receiver has a resolution of 2 impulses per measured volume with a pulse duty factor of 1:1.

The signal frequency of the output impulses is proportional to the speed of rotation of the gear wheel and to the flow velocity and must be processed by the connected electronic readout according to the values of the impulses.

The output impulses of the fibre optic receiver can be either a PNP- or a NPN-switched signal. The coding of the signals is easily possible and is performed on 2 separately programmable jumper bars in the receiver.

PERFORMANCE CHARACTERISTICS OF THE FAULT SIGNAL OUTPUT

If a low battery state is signalled, the green LED "Ready" extinguishes and the fault signal output becomes active, operation of the system remains possible for a certain time.

The green LED "Ready" is switched on and the fault signal output is reset automatically when a new battery has been installed in the signal pick-up body.

The fault signal output also becomes active on the following transmission errors of the optical fibre, by which the red LED "transmission error" also lights:

- A. Interruption of the optical fibre
- B. Incorrect connection
- C. Weak optical signal

FLOW METER SELECTION

The correct choice (interpretation) of the type and size of flow meter is essential for a trouble-free and safe operation. Due to the large number of different applications and flow meter models, the technical data in the VSE catalogues are of a general nature. Certain characteristics of the devices depend on type, size and measuring range as well as the liquid to be measured. Please consult VSE for an exact choice of flow meter.

Special designs are available on request

BARRIER AMPLIFIER "MK 13-P-EX 0/24 V DC/K15" FOR VHM FLOW METERS

VSE provides the barrier amplifier type "MK 13-P-Ex 0/24 V DC/K15" for the application of VHM flow meters in areas with explosion hazards. This operates in conjunction with the pick-up systems of VHM flow meters.

The barrier amplifier has an intrinsically safe control circuit and is equipped with galvanic isolation between the control and output circuits to the supply. It contains a pulse-switching, short-circuit resistant transistor output and is connected with screw terminals. The amplifier is installed in a plastic housing and is fitted with a snap-in mounting for attachment to an installation rail.

The barrier amplifier must be installed outside the Ex-area in an electrical cabinet or terminal box. The intrinsically safe control lines must be laid and marked according to the design specifications of VDE 0165.
